operations research often solves deterministic optimization problems based on elegantand conciserepresentationswhereall parametersarepreciselyknown in the face of uncertainty probability theory is the traditional tool to be appealed for and stochastic optimization is actually a signi cant sub area in operations research however the systematic use of prescribed probability distributions so as to cope with imperfect data is partially unsatisfactory first going from a deterministic to a stochastic formulation a problem may becomeintractable agoodexampleiswhengoingfromdeterministictostoch tic scheduling problems like pert from the inception of the pert method in the 1950 s it was acknowledged that data concerning activity duration times is generally not perfectly known and the study of stochastic pert was launched quite early even if the power of today s computers enables the stochastic pert to be addressed to a large extent still its solutions often require simplifying assumptions of some kind another di culty is that stochastic optimization problems produce solutions in the average for instance the criterion to be maximized is more often than not expected utility this is not always a meaningful strategy in the case when the underlying process is not repeated a lot of times let alone being one shot it is not clear if this criterion is realistic in particular if probability distributions are subjective expected utility was proposed as a rational criterion from rst principles by savage in his view the subjective probability distribution was sically an artefact useful to implement a certain ordering of solutions
